

Tablekeeper

Reservations that hold up.

I wanted a booking experience people can trust, and a development process someone else can inspect.

FOUR STAGES / ONE RECORDED FACTORY

Athos Figueiredo

Designer and developer

A reservation should stay a reservation.

Even when guests book at the same time, retry a request, or change their plans.

01

One available table

Two guests request the same seating. Only one booking can be confirmed.

No overlapping confirmations.

02

A repeated request

The connection drops after booking. A retry must recover the original receipt.

One request. One reservation.

03

A change of plans

A change involves several bookings. If it cannot complete, keep the original plan intact.

All changes, or none of them.

Clear choices. Visible confirmation.

Find seating, reserve one table or a declared pair, and retrieve the same confirmation when retrying.

DESKTOP / REAL SERVICE

Synthetic restaurant and users. Screens captured from the accepted build.

375PX / REAL UI

Three roles. One shared record.

Two initial dispatches: Stage 1, then the complete Stage 2-4 sequence. Repairs and handoffs happen between agents.

PLANNER

Define the work.

Reads the specification, maps acceptance criteria and coordinates handoffs.

BUILDER

Commit the work.

Implements the service and hands over a frozen revision with its evidence.

REVIEWER

Challenge the work.

Builds independent checks, rejects defects and verifies the repaired source.

Generic mandates describe the method. The specification describes the product.

Proof before polish.

Each folder is a complete service. Earlier behavior is checked again as the product grows.

STAGE	SOURCE REVISION	CUMULATIVE OFFICIAL CHECKS	OUTCOME
01	0f96bf0	120 / 120	PASSED
02	2e026c0	145 / 145	PASSED
03	4b7b062	152 / 152	PASSED
04	8c6df7f	158 / 158	PASSED

Isolated containers. No failed, skipped or deselected checks in these completed suites. Independent API and browser review supplements the shipped tests.

A reviewer that can say no.

Stage 1 was rejected for contract defects. Another defect surfaced after the shipped tests were already green.

FR Figueira Reviewer 13:57

@Figueira Builder

Additional verified evidence for the existing repair/recheck loop; no separate acknowledgement needed. Official isolated run on frozen f95a5cbbfcbbb64bb8841d7fdcfc74f6150e5d40 completed: 120 collected, 114 passed, 6 failed, zero skips/errors, 28.42 s; harness exit 1. All six failures reject the two-restaurant fixture at reset with 422 instead of 204 because each restaurant reuses table IDs t_1/t_2/t_3. The model does not require table IDs globally unique across restaurant catalogues; table identity/occupancy must use restaurant_id plus table_id. Existing restaurants_from_fixture uses a global table_ids set and overlap compares only table_id. Please include this genuine third defect in the new repair commit and preserve cross-restaurant occupancy isolation and import.

REAL BAND RECORDING / FIRST REJECTION / f95a5cb

Stage 2 also caught and repaired mobile overflow. The original failures remain in the evidence.

The next stage earns its place.

Accepted folders are preserved. Every extension starts from a copy of the previous stage.

01	API	Reservations, scoped retries, atomic moves and portable state.	VERIFIED
02	Product	Booking UI, paired tables, lost-response recovery and lookup.	VERIFIED
03	History	Versioned policies, recurring agreements and inherited receipts.	VERIFIED
04	Amendments	Series changes and closure plans with collective corrections.	VERIFIED

Quality has a measurable cost.

Independent review adds work. It also caught defects that the shipped checks did not expose.

STAGE 1 / DISPATCH TO REPORT

1 h 06 min 47 s

Tradeoff: complete handoffs and independent checks use more time and context than a single agent. The benefit is a review trail tied to exact source revisions.

STAGES 2-4 / DISPATCH TO ACCEPTANCE

1 h 51 min 02 s

One transaction boundary favors correctness under the specified load. Four separate folders favor reproducibility over avoiding duplicated source.

Model spend: not reliably attributable to this room. Existing account allocation was used; a dollar figure is unavailable, not zero. No new paid infrastructure was activated.

See the work. Check the process.

The public repository contains the four stages, factory method, generic mandates, verification reports and the full BAND room export.

```
docker build -t tablekeeper stage-4
docker run --rm --cpus=2 --memory=2g \
  -p 8080:8080 tablekeeper
curl http://localhost:8080/health
```

Open localhost:8080. Load a synthetic fixture through the documented test reset endpoint.
State is ephemeral; this is a contest prototype.

github.com/athosfif/tablekeeper-band-dark-factory

WHAT TO INSPECT

Factory

FACTORY.md, mandates and room.json

Product

Four folders, each with Dockerfile and RUN.md

Verification

Exact revisions, commands and original reports
